**Acknowledgement** *The Authors would like to acknowledge Professor John J. Quinn as coauthor of original ideas of chapters 8 and 9.*

# Table of contents

|                                                                                                           |       |
|-----------------------------------------------------------------------------------------------------------|-------|
| <b>1. Introduction</b>                                                                                    | ..... |
| <b>2. Topological methods for description<br/>of quantum many-body systems</b>                            | ..... |
| 2.1. Configuration spaces of quantum many-body systems<br>of various dimensions                           | ..... |
| 2.2. Quantization of many-body systems                                                                    | ..... |
| 2.3. The first homotopy group for the many-particle<br>configuration space – braid groups                 | ..... |
| 2.4. Braid groups for specific manifolds                                                                  | ..... |
| <b>3. Quantization of many-particle systems<br/>and quantum statistics in lower dimensions</b>            | ..... |
| 3.1. Topological limitations of quantum-mechanical description<br>of many-particle systems                | ..... |
| 3.2. Quantum statistics and irreducible unitary representations<br>of braid groups for selected manifolds | ..... |
| 3.3. Non-Abelian statistics                                                                               | ..... |

|                                                                                        |  |
|----------------------------------------------------------------------------------------|--|
| <b>4. Topological approach to composite particles</b>                                  |  |
| <b>in two dimensions</b> .....                                                         |  |
| 4.1. Mathematical model of composite particles.....                                    |  |
| 4.2. Configuration space for the system of composite particles.....                    |  |
| <b>5. Many-body methods for Chern–Simons systems</b> .....                             |  |
| 5.1. Random phase approximation for an anyon gas.....                                  |  |
| 5.2. Correlation energy of an anyon gas.....                                           |  |
| 5.3. Hartree–Fock approximation for Chern–Simons systems.....                          |  |
| 5.4. Diagram analysis for a gas of anyons.....                                         |  |
| <b>6. Anyon superconductivity</b> .....                                                |  |
| 6.1. Meissner effect in an anyon gas at $T = 0$ .....                                  |  |
| 6.2. Gas of anyons at finite temperatures.....                                         |  |
| 6.3. Higgs mechanism in an anyon superconductor.....                                   |  |
| 6.4. Ground state of an anyon superconductor in the Hartree–Fock<br>approximation..... |  |
| <b>7. The fractional quantum Hall effect</b>                                           |  |
| <b>in composite fermion systems</b> .....                                              |  |

|                                                                |  |
|----------------------------------------------------------------|--|
| 7.1. Hall conductivity in a system of composite fermions ..... |  |
| 7.2. Ground state energy of composite fermion systems .....    |  |
| 7.3. Metal of composite fermions.....                          |  |
| 7.4. BCS paired Hall state.....                                |  |
| <b>8. Quantum Hall systems on a sphere.....</b>                |  |
| 8.1. Spherical system .....                                    |  |
| 8.2. Composite fermion transformation .....                    |  |
| 8.3. Hierarchy .....                                           |  |
| <b>9. Pseudopotential approach to the fractional quantum</b>   |  |
| <b>Hall states.....</b>                                        |  |
| 9.1. Problems with justification of the composite              |  |
| fermion picture .....                                          |  |
| 9.2. Numerical studies on the Haldane sphere.....              |  |
| 9.3. Pseudopotential approach .....                            |  |
| 9.4. Energy spectra of short range pseudopotentials .....      |  |
| 9.5. Definition of short range pseudopotential .....           |  |
| 9.6. Application to various pseudopotentials .....             |  |
| 9.7. Multi-component systems .....                             |  |

**Appendix A. Homotopy groups.....**

**Appendix B. Correlation function for anyon gas  
in the self-consistent Hartree approximation .....**

**Index .....**

**References.....**
